1. Database Configuration

JABS default database configuration is HSQL. This is the preferred database, since it is fully integrated into the JABS server. But, for installations that may have large, frequent job schedules, a separate database may be preferable. For these situations, you can change the back end database. Changing the configuration is a bit cumbersome at the moment. It requires you to edit a XML file inside the web application and restart the server. When you install a new release of the web application, you will need to reapply these settings. A configuration page will be included in a future release to maintain these settings.
