1. Sites

This feature allows one JABS instance to act as a management console for one or more remote sites. Currently, this feature only supports project browsing and remote project execution.

1.1. Sites List

Sites List

Field	Description
Name	A short descriptive name for the link.
URL	The JABS site URL.
Version	The version of the remote site. This is read from the site when the URL is validated.
Build	The build of the remote site. This is read from the site when the URL is validated.

1.2. Site Browse

After a valid URL is entered into the site list, you can navigate the site tree and view the project list and active projects.

Sites List

To run a project, click the Run image and select the desired run group. At this point, your user credentials are checked to see if you have permissions to run the project. This security check requires your user id and password to be the same. You will get an authentication error if they don't match.
